

# Science of Team Science: Informing Strategic Institutional Support

Kara L. Hall, PhD

---

*Director, Science of Team Science (SciTS)*  
*Director, Theories Initiative*  
*Health Scientist*  
*Program Director*  
Behavioral Research Program  
Division of Cancer Control and Population Sciences  
National Cancer Institute

What is the evidence for the value of building diverse teams?

What is the power of diverse teams?

[diverse teams = broad range of team member characteristics - demographic, discipline, type of team members (e.g., scientist, community, patients, industry partners)]

*Why we should deal with the  
challenge of building and supporting diverse teams?*

... because it seems pretty hard  
to foster, build, and sustain diverse teams in science...

# Battier Effect

(Daryl Morey, Rockets GM)

The No-Stats All-Star

Robert Seale for The New York Times

Statistical Anomaly: His greatness is not marked in box scores or at slam-dunk contests, but on the court, Shane Battier

“His greatness is not marked in the box scores or at slam-dunk contests, but on the court **Shane Battier makes his team better**, often much better and his opponents worse often much worse.”

New York Times, Feb 15, 2009

# Rewards, Recognition, and Contracts

- “There is a tension, peculiar to basketball, **between the interests of the team and the interests of the individual.** The game continually tempts the people who play it to do things that are not in the interest of the group.”
- “We think about this deeply whenever we’re talking about **contractual incentives... We don’t want to incent a guy to do things that hurt the team**” — and the amazing thing about basketball is how easy this is to do.
- “**They all maximize what they think they’re being paid for,**” he says. He laughs. “It’s a tough environment for a player now because **you have a lot of teams starting to think differently. They’ve got to rethink how they’re getting paid.**”

New York Times, Feb 15, 2009

# Variations in Team Science

# Collaboration Is Complex

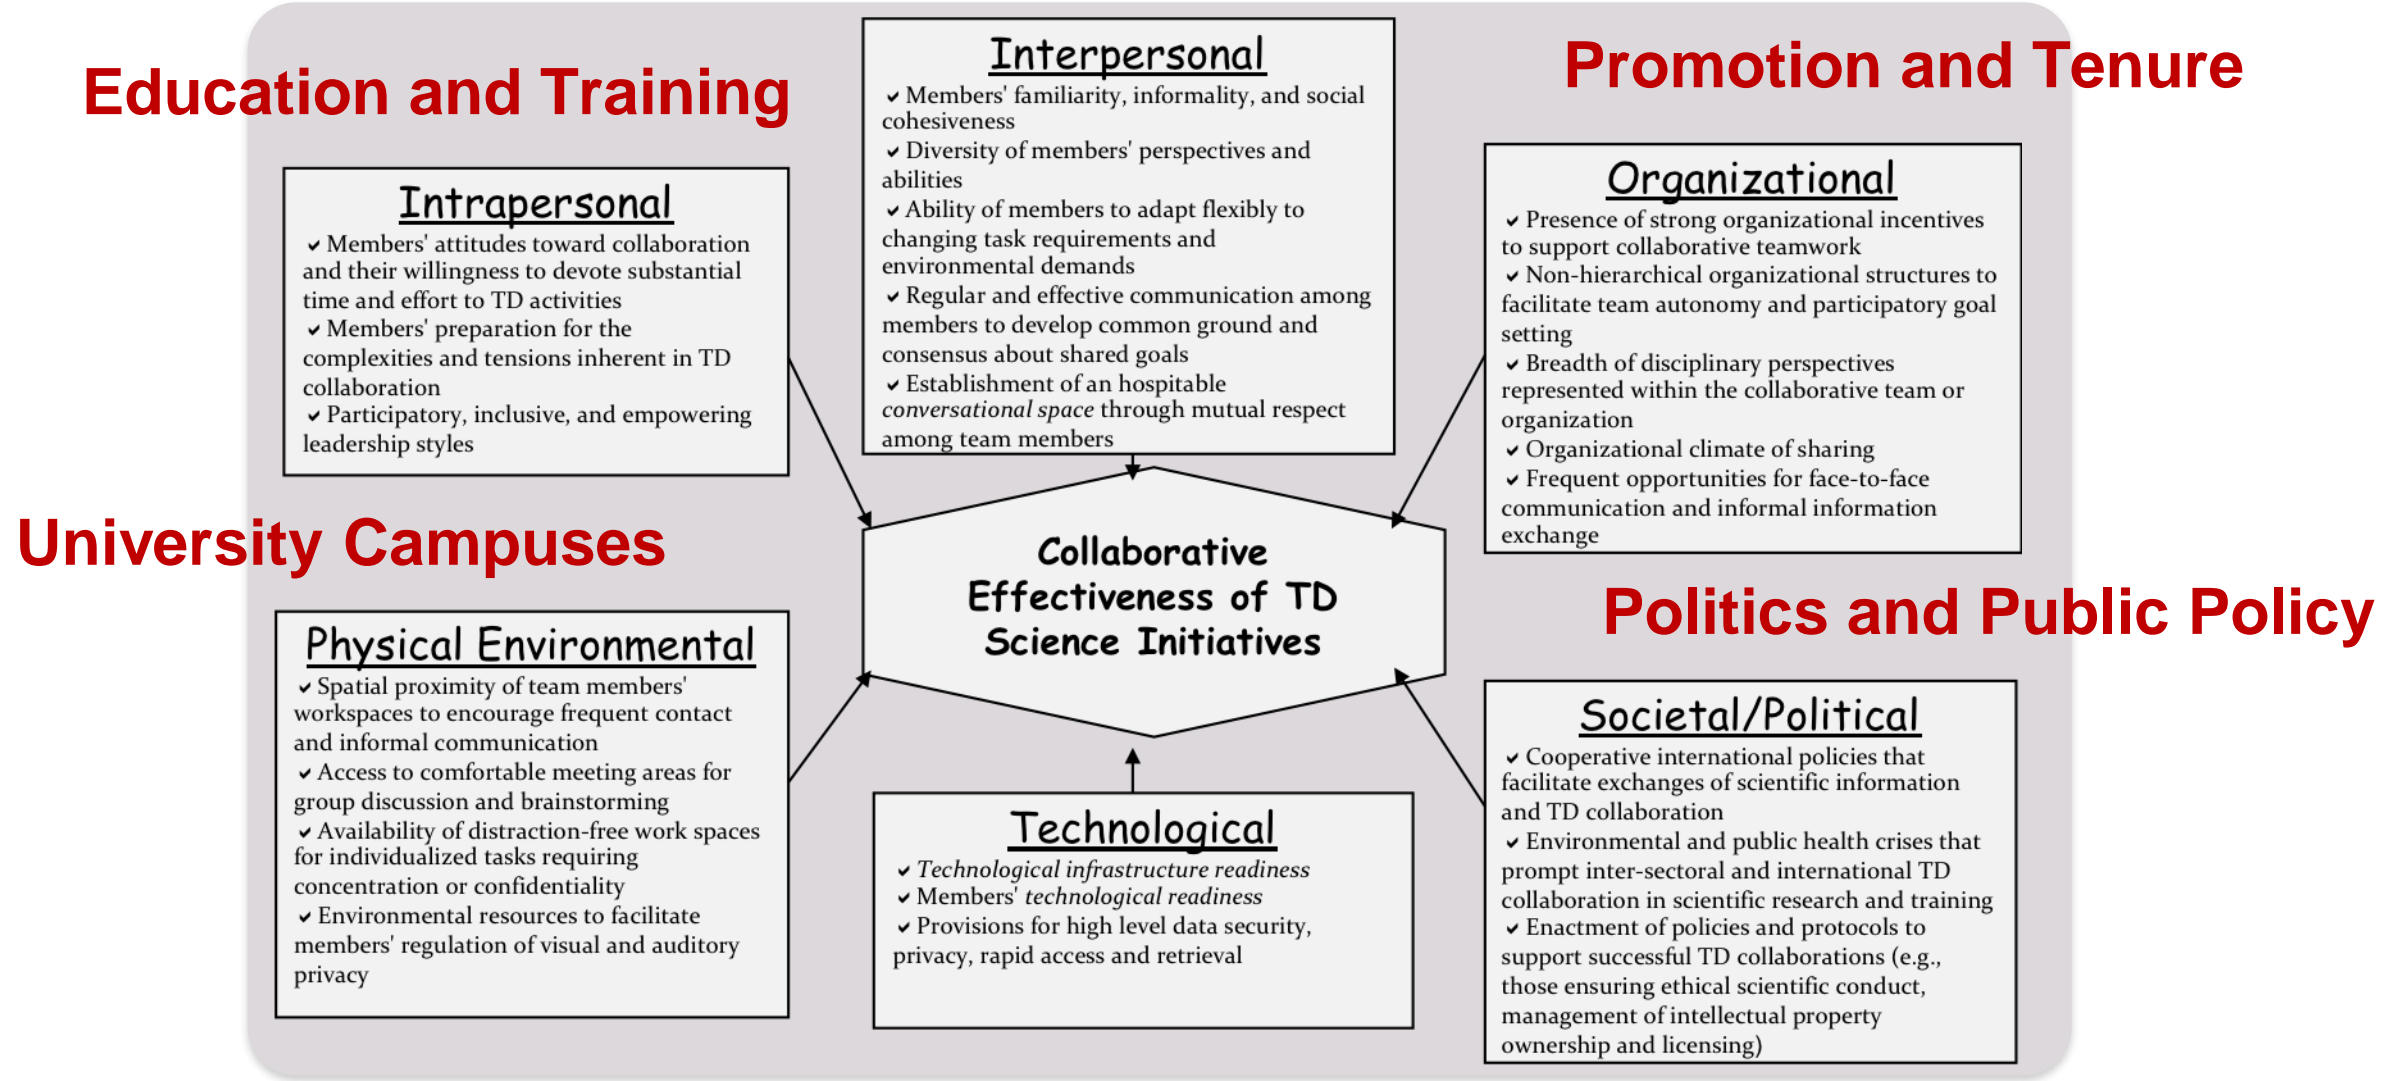

## Multi-level Contextual Factors

Stokols, D., Misra, S. Moser, R., Hall, K. L., & Taylor, B. (2008). The ecology of team science: Understanding contextual influences on transdisciplinary collaboration. *American Journal of Preventive Medicine*, 35, 2, S96-S115.

# Constraints of Legacy Systems

Stokols, D., Misra, S. Moser, R., Hall, K. L., & Taylor, B. (2008). The ecology of team science: Understanding contextual influences on transdisciplinary collaboration. *American Journal of Preventive Medicine*, 35, 2, S96-S115.

# What might we ask ourselves?

- What do we need to **advance science** and to **address** our **complex challenges**?
- **Do our recognition and rewards align** with those needs?
- **How** can we help to **better align** recognition and rewards with those needs?
- What are the opportunities to **shift culture**?
- How can we provide **structures to guide** those changes?
- **Do we know what we need to know** to offer clear guidance?

# Introduce the Science of Team Science (SciTS)

Highlight key findings from SciTS and NCI's SciTS Initiative

COMPONENT	CONSIDERATIONS	COMPONENT	CONSIDERATIONS
1. Mission, Vision, and Objectives	• Define the team's purpose and goals • Align with organizational strategy	6. Resource Management & Allocation	• Identify needed resources • Allocate resources effectively
2. Collaborative Structure	• Determine team composition • Define roles and responsibilities	7. Conflict Resolution & Management	• Establish conflict resolution processes • Foster a collaborative environment
3. Communication & Coordination	• Establish communication protocols • Use collaborative tools	8. Monitoring & Evaluation	• Track team progress • Evaluate team performance
4. Team Dynamics & Culture	• Promote trust and respect • Encourage open communication	9. Knowledge Management & Sharing	• Document team knowledge • Share insights and findings
5. Flexibility & Adaptability	• Be open to change • Adapt to evolving needs	10. Sustainability & Continuity	• Plan for team's long-term success • Ensure knowledge transfer

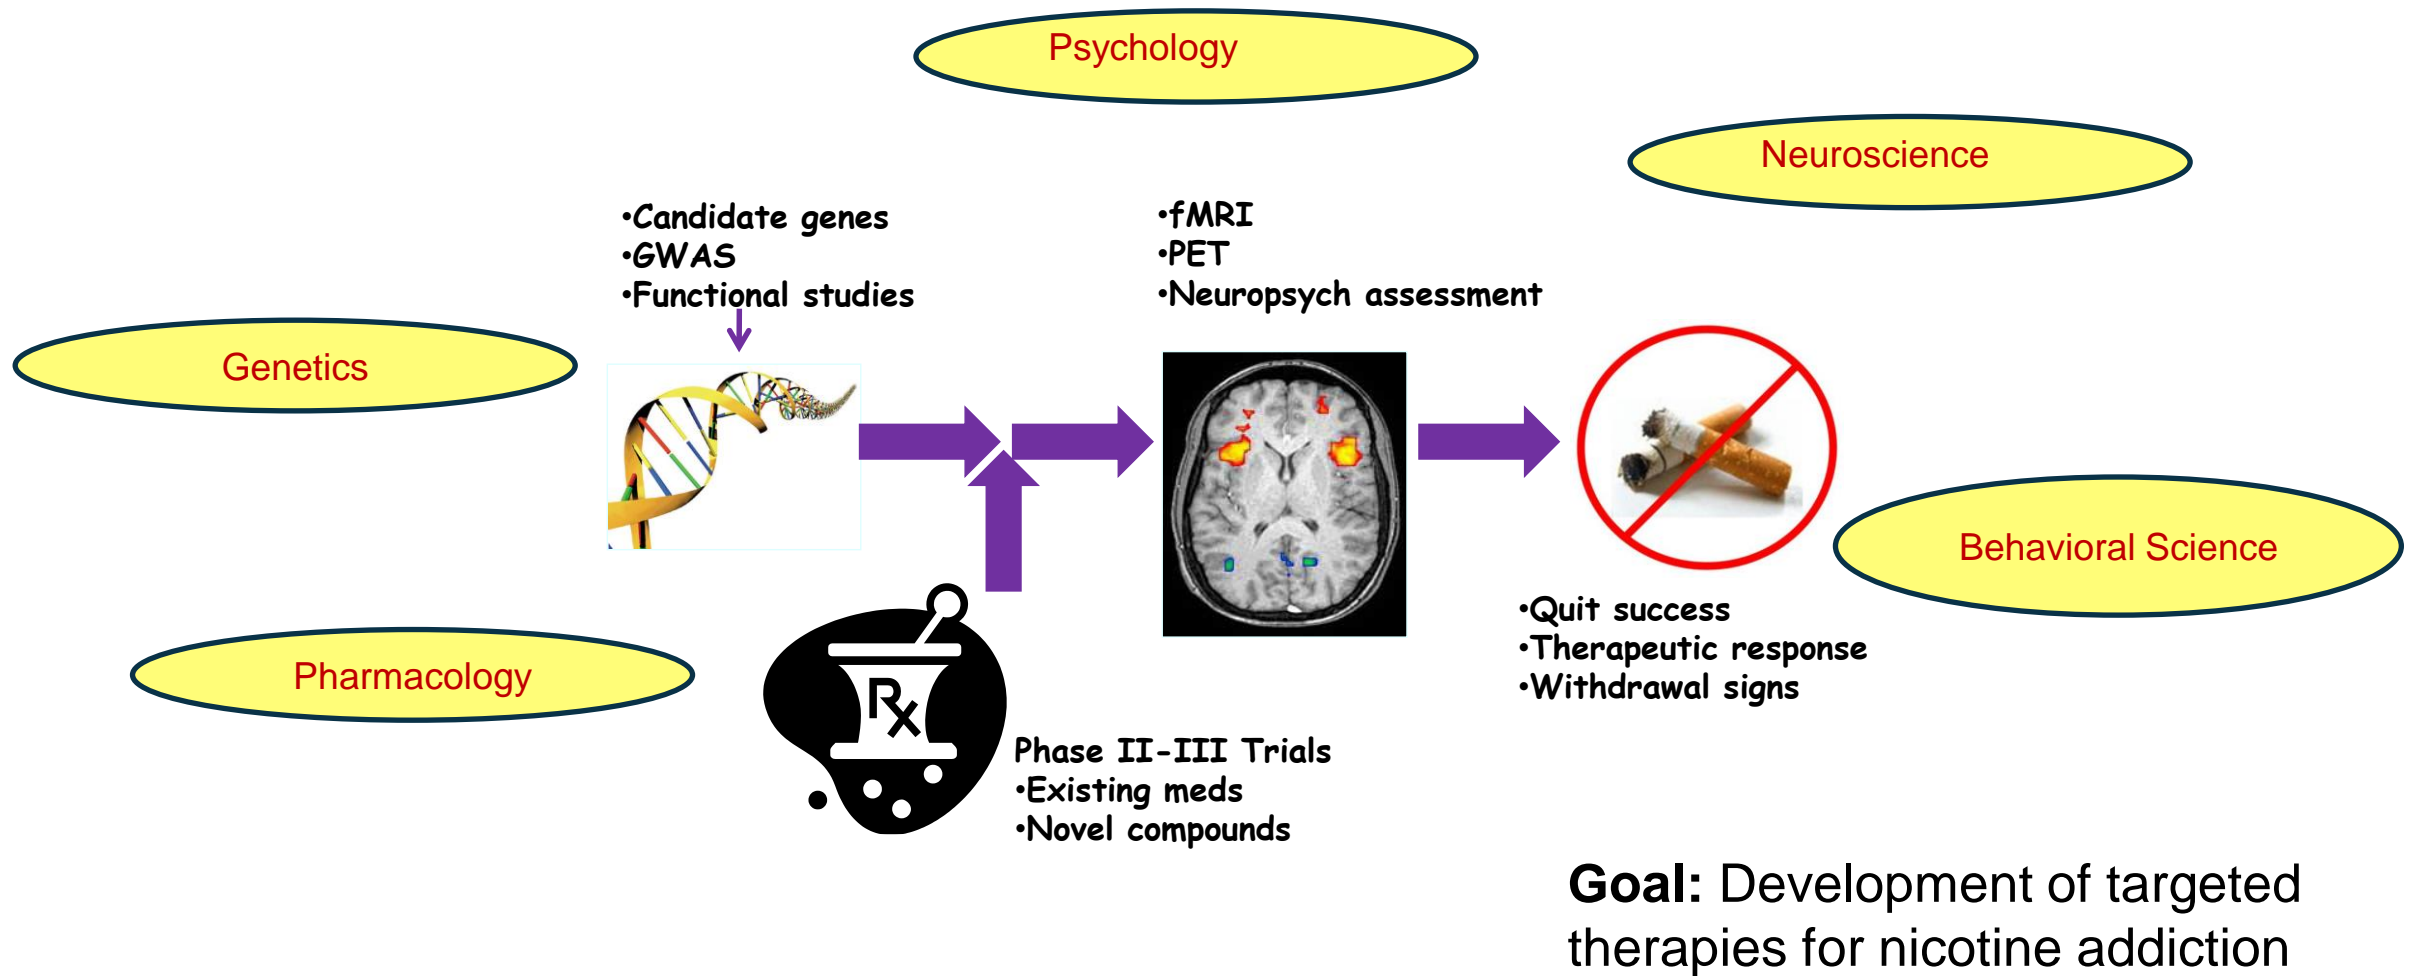

Discuss strategies and lessons learned to facilitate and support team science

# Dimensions of Team Science

That Create Unique Profiles & Challenges

DIMENSION	RANGE	
Diversity	HOMOGENEOUS	HETEROGENEOUS
Integration	UNIDISCIPLINARY	TRANSDISCIPLINARY
Size	SMALL (2)	MEGA (1000S)
Proximity	CO-LOCATED	GLOBALLY DISTRIBUTED
Goal alignment	ALIGNED	DIVERGENT OR MISALIGNED
Boundaries	STABLE	FLUID
Task interdependence	LOW	HIGH

“What is the **value of team science**? What does TS add over individually-driven science? (If anything....)”

“Do **cross-disciplinary** teams produce **more innovative science** than unidisciplinary teams?”

Administrators:  
“How do we create an **organizational environment** that fosters successful TS?”

Funders: “Is it a wise financial investment to **fund large teams**? Could it be more efficient to fund smaller investigator driven-grants?”

Researchers: “How do I go about **forming a new team**? And once I’ve done that, what **proven strategies** can I use to help us succeed?”

Researchers: “What approaches can I use to more easily **collaborate with colleagues from very different disciplines**?”

**The Science of Team Science** is a cross-disciplinary field of study that aims to: **(1) generate an evidence-base** and **(2) develop translational applications** to help maximize the efficiency, effectiveness of team science.

- **What is the added value of team science?** Can it ask and answer new questions, produce more comprehensive knowledge, generate more effective applied solutions?
- **What team processes** (e.g., communication, coordination approaches) help maximize scientific innovation and productivity?
- What **characteristics and skills** of team leaders and team members facilitate successful team functioning?
- How can **funding agencies and universities** most effectively facilitate and support team science, in order to advance discovery? **What policies are needed?**

## Collaboration Plans: Planning for Success in Team Science

Kara L. Hill, Ph.D., Health Scientist and Director, SaTS Team, Behavioral Research Program, National Cancer Institute, National Institutes of Health, Bethesda, MD 20892  
 Amanda L. Vogel, Ph.D., M.P.H., Senior Behavioral Scientist, Clinical Research Directorate/CDMP, Leidos Biomedical Research Inc., Frederick National Laboratory for Cancer Research, Frederick, MD 21702  
 Kevin Crowston, Ph.D., Distinguished Professor of Information Science, Syracuse University School of Information Studies, Syracuse, NY 13244

COMPONENT	CONSIDERATIONS	COMPONENT	CONSIDERATIONS
<b>1 Rationale for Team Approach &amp; Configuration</b>	<ul style="list-style-type: none"> <li>Justify why a team approach is necessary to meet the research objectives.</li> <li>Describe why the team configuration meets the proposed research objectives (e.g., how each team member uniquely contributes).</li> </ul>	<b>6 Leadership, Management, &amp; Administration</b>	<ul style="list-style-type: none"> <li>Describe the leadership and management approaches that will be used to address the other components in the collaboration plan, given the specific team context that has been proposed (e.g., the individual team members, team characteristics, involved institutions and organizations).</li> <li>There are numerous approaches to leadership (e.g., hierarchical, bureaucratic, transformational, transactional). The most successful outcomes are produced by combining various approaches as appropriate to the context.</li> <li>Leadership and management are key influences on the success of a scientific collaboration.</li> <li>More complex team science initiatives require more sophisticated leadership and management approaches.</li> </ul>
<b>2 Collaboration Readiness</b>	<ul style="list-style-type: none"> <li>Provide evidence for the collaboration readiness of (1) the individual researchers, (2) the team as a unit, and (3) the institutions and organizations that are involved.</li> <li>A given project may not have high levels of collaboration readiness in all of these areas. A plan may highlight strengths and describe strategies to compensate for any weaknesses.</li> </ul>	<b>7 Conflict Prevention &amp; Management</b>	<ul style="list-style-type: none"> <li>Describe strategies and systems for preventing and managing conflicts (e.g., processes for inviting and sustaining diverse perspectives, preventing or managing negative forms of conflict, encouraging debate and facilitating productive forms of conflict, and resolving conflict).</li> <li>Many sources of team conflict can be anticipated, and strategies should be developed to address them.</li> <li>Demographic and disciplinary diversity both may lead to conflict, but the specific areas of conflict, and the ways in which conflicts play out, will vary with the unique combination of types of diversity on the team.</li> <li>Team members with similar training may underestimate the potential for conflict as a result of incorrect assumptions about areas of agreement.</li> <li>Subgroups may produce false leads.</li> </ul>
<b>3 Technological Readiness</b>	<ul style="list-style-type: none"> <li>Document the availability and planned use of technological resources to facilitate:                             <ul style="list-style-type: none"> <li>Data sharing and collaborative data analysis (e.g., data sharing agreements, common data analysis and management software).</li> <li>Communication (e.g., video- and teleconferencing, calendaring, wikis, and)</li> <li>Coordination (e.g., calendaring, work flow or project management tools).</li> </ul> </li> <li>TS includes 3 components: (1) technology must be available; (2) members must be willing to use the technologies; and (3) members must have the skills to use them.</li> <li>Additional issues may include: compatibility and interoperability of systems across collaborators; decisions concerning whose systems or processes will be used.</li> </ul>	<b>8 Training</b>	<ul style="list-style-type: none"> <li>Describe a training plan for team members at the start of the collaboration and throughout (e.g., training relevant to team processes, leadership, management, communication, coordination).</li> <li>For interdisciplinary (ID) teams, this plan should involve cross-training in multiple scientific areas, and training in ID science competencies (e.g., critical awareness of the strengths and weaknesses of all disciplines; strategies for combining approaches from multiple disciplines).</li> <li>Ongoing, rather than one-off, training is needed to maintain and build competencies and address evolving needs.</li> <li>Training should be designed to meet a wide variety of needs: by career stage, learning style, interests, and practical constraints (e.g., web-based training for distributed teams).</li> <li>Evidence-based training approaches exist for both individuals and teams (e.g., team coordination training, team reflexivity training, cross-training).</li> <li>Teams that engage in systematic and iterative reflection about team performance and subsequently adjust their team objectives and processes show better performance, including higher levels of innovation.</li> <li>Not every team needs to be held to the same standards for training.</li> </ul>
<b>4 Team Functioning</b>	<ul style="list-style-type: none"> <li>Describe strategies that will be used to address key team processes that are essential to effective team functioning.</li> <li>Examples of strategies include development of cooperative agreements and operating manuals, participation in the Toolbox Project facilitated workshops (<a href="http://www.cdc.ca/tds/tds/toolbox/">http://www.cdc.ca/tds/tds/toolbox/</a>), and implementation of team diagnostic surveys for quality improvement.</li> <li>Strategies should take into account the unique characteristics of the team and the scientific work, such as collaborative history, complexity of the team (e.g., size, diversity, dispersion, task interdependence), phases of the research process.</li> <li>Strategies should be directly tied to achieving key team processes (e.g., general a shared mission and goals, externalizing group cognition, creating shared mental models, generating shared language).</li> </ul>	<b>9 Quality Improvement Activities</b>	<ul style="list-style-type: none"> <li>Describe what processes will be put in place to ensure continuous quality improvement specific to team functioning, in order to help:</li> <li>Teams that engage in systematic and iterative reflection about team performance and subsequently adjust their team objectives and processes show better performance, including higher levels of innovation.</li> <li>Not every team needs to be held to the same standards for training.</li> </ul>
<b>5 Communication &amp; Coordination</b>	<ul style="list-style-type: none"> <li>Describe ways communication will occur (e.g., meeting frequency and modality).</li> <li>Describe strategies to coordinate day-to-day operations and the achievement of scholarly benchmarks.</li> <li>Plans should be specific to your team. For example, distance collaborations increase potential communication and coordination challenges. Communication coordination styles may vary among collaborators who vary in age, gender, and culture and for collaborators from different disciplines.</li> </ul>

# Boundary Spanning Collaborations

## Greater Scientific Impact

- **Countries:** International teams and teams from more locations generally yield **higher impact publications**
  - with certain countries (e.g., US) and universities (R1) increasing the likelihood of positive impacts
- **Universities:** Publications with authorship teams spanning different universities produced **higher impact work than comparable co-located teams or solo scientists**
- **Departments:** One study found that although the number of departments had a negative effect on a specific type of innovation impact (patents), prior experience among team members reverses this effect

### What have we learned from SciTS?

Generally, collaborations spanning organizational and contextual boundaries enhance the impact of the research.

Hall, K. L., Vogel, A. L., Huang, G. C., Serrano, K. J., Rice, E. L., Tsakraklides, S. P., & Fiore, S. M. (2018).

The science of team science: A review of the empirical evidence and research gaps on collaboration in science. *American Psychologist*, 73(4), 532-548.

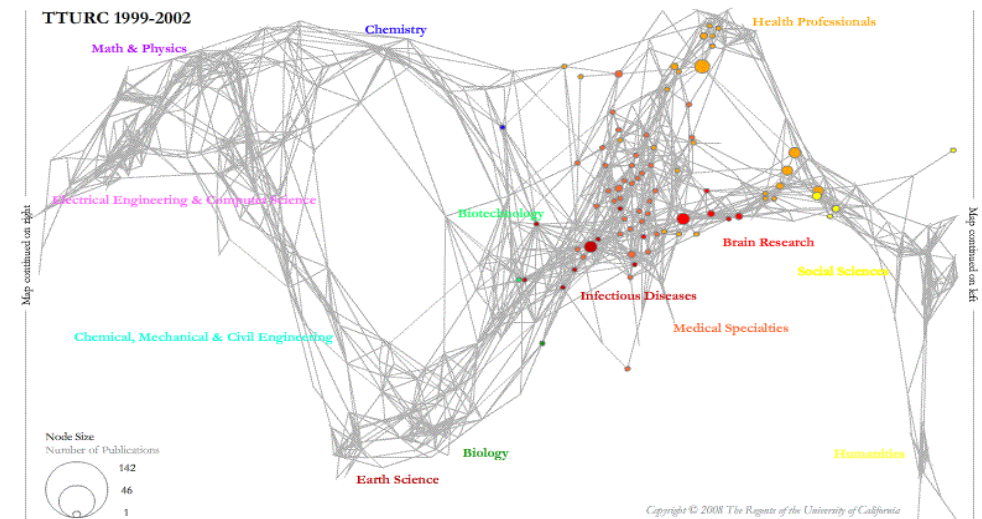

# Disciplinary Diversity

## Cross-disciplinary teams

- Found to be **more productive** than comparison teams, as indicated by publications
- Produce **more innovative** products than unidisciplinary teams
- Tend to generate publications with **greater scientific impact**
- **Greater cross-fertilization** via publications with broader reach and decreased specialization
- Identify **new previously unexplored areas** at the intersection of fields/domains

### What have we learned from SciTS?

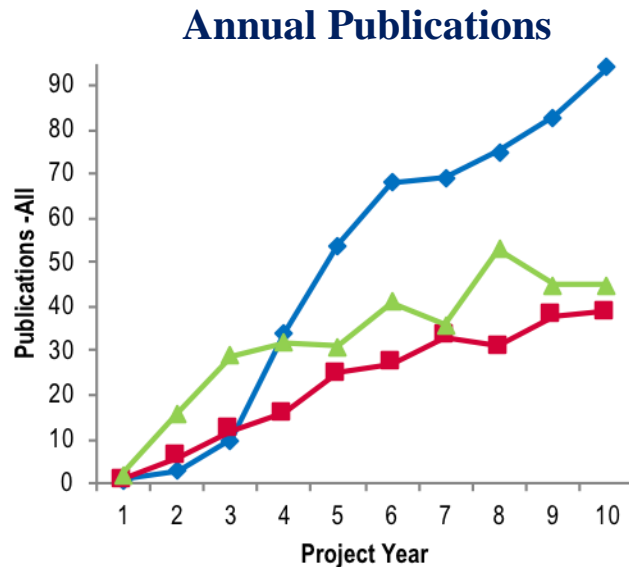

CD are found to be more productive, innovative, yield greater scientific impact, and result in broader dissemination of results.

Hall, K. L., Vogel, A. L., Huang, G. C., Serrano, K. J., Rice, E. L., Tsakraklides, S. P., & Fiore, S. M. (2018).

The science of team science: A review of the empirical evidence and research gaps on collaboration in science. *American Psychologist*, 73(4), 532-548.

# Productivity of TD Center Grants and R01 Investigator-Initiated Grants

**TD center publications have longer start up period compared to R01s but become more productive over time**

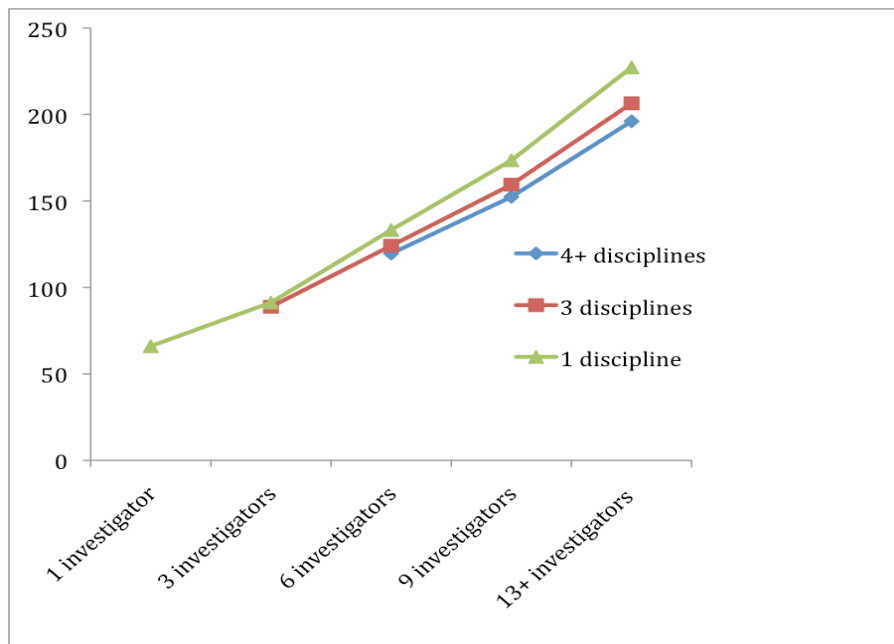

Centers initial **lag** in number of publications is **eliminated around Project Year 4.**

Method: Quasi-experimental design comparing number of publications of TTURC initiative with matched R01 projects from the tobacco field over 10-year period

# Multi-disciplinary & Multi-Institutional Team Science Productivity

Predicted # of publications as a function of research group size & heterogeneity as measured by # of disciplines of the investigators

Predicted # of publications as a function of research group size & group heterogeneity as measured by # of institutions involved in the research

**Key Findings:** **On average**, as the number of investigators increase, greater numbers of disciplines and institutions, results in less productivity (**important caveat!**)

# Coordination, Coordination, Coordination

## Enhances success

The projects that used **more coordination mechanisms** had **more successful outcomes**, e.g.,

- Division of responsibility, knowledge transfer, direct supervision, face-to-face mechanisms

**The greater number of universities involved - predicted fewer coordination activities and fewer project outcomes.**

- **Dispersed projects that used more coordination mechanisms were more successful** than dispersed projects that used fewer coordination mechanisms

**Increases in complexity** (e.g., communication, team dynamics, organizational and global bureaucratization) occur **as the number of team dimensions** (e.g., size, disciplines, distribution) **increase.**

- *Thereby, complex teams require more resources for coordination and management*

### Summary Points

- The use of coordination mechanisms is critical for success.
- The number of coordination mechanisms should increase as the complexity of the project increases.

### Practical considerations:

- Coordination that **addresses team principles** as related to **team profiles**
- Leaders, managers, facilitators attuned to these principles and require *specialized skills and strategies*

# Team Size & Composition

Scientific progress and breakthroughs

- **Team size:** “**small teams** are more likely to produce articles, patents and software that **disrupt the system** by drawing inspiration from older and less popular ideas, while **larger teams build on, solve and refine important ideas** from the immediate past.”
- **Networks:** Nobel prize winning **breakthroughs** often come from **papers that are not highly cited** and emerge from a **small network** of researchers
- **History of collaboration:** Enhances impact and productivity, yet decreases breakthrough products
- **Newcomers:** A **combination of members** with a history of collaboration and new team members increase the likelihood of publishing in the most prominent journals

Hall, K. L., Vogel, A. L., Huang, G. C., Serrano, K. J., Rice, E. L., Tsakraklides, S. P., & Fiore, S. M. (2018). The science of team science: A review of the empirical evidence and research gaps on collaboration in science. *American Psychologist*, 73(4), 532-548.

## Summary Points

Team size and characteristics can influence the type of outcomes produced.

## Practical Considerations:

- What is the ideal team size? 6-9?
- Depends on scope and complexity of problem
- Coordination:
  - Structure
  - Process
  - Resources

# Gender , Cultural, & Ethnic Diversity

## Enhances Outcomes

### Gender diversity

- **Gender-Heterogeneous** authorship teams receive **34% more citations** than same-gender
- Scientific teams with **at least one female PI are more likely to win grant proposal** or produce more **innovative ideas.**

### Cultural/Ethnic diversity

- Across several studies - **moderate levels of diversity appear to be better than no diversity or very high levels diversity.**

#### Practical Considerations:

- Diversity adds value
- High levels of diversity increases complexity
- Understand and consider faultlines

# The Role of Roles

## Differential Influence on Team Effectiveness

- **Post-docs with external funding, graduate students, and technicians**
  - Increase the likelihood of **breakthrough publications**
- **Postdocs with project funding**
  - **Higher productivity**
- **Senior co-authors/Higher rank**
  - Publication in higher-impact journals than articles co-authored by junior researchers
  - Positive effect on both collaboration and productivity
- **Brokers**
  - Help to keep a network of researchers interacting
  - Increase scientific output
  - Higher production of scientific discoveries

### Summary Points:

The inclusion of different types of roles on team can impact team effectiveness, leading to different kinds of outcomes.

### Practical Considerations:

- Why do we see these differences?
- How can we better align team configuration with goals?
- What about stakeholder involvement?

Hall, K. L., Vogel, A. L., Huang, G. C., Serrano, K. J., Rice, E. L., Tsakraklides, S. P., & Fiore, S. M. (2018).

The science of team science: A review of the empirical evidence and research gaps on collaboration in science. *American Psychologist*, 73(4), 532-548.

# Transdisciplinary Research on Energetics and Cancer

**116+ investigators**  
**30+ disciplines**  
**5 sites**

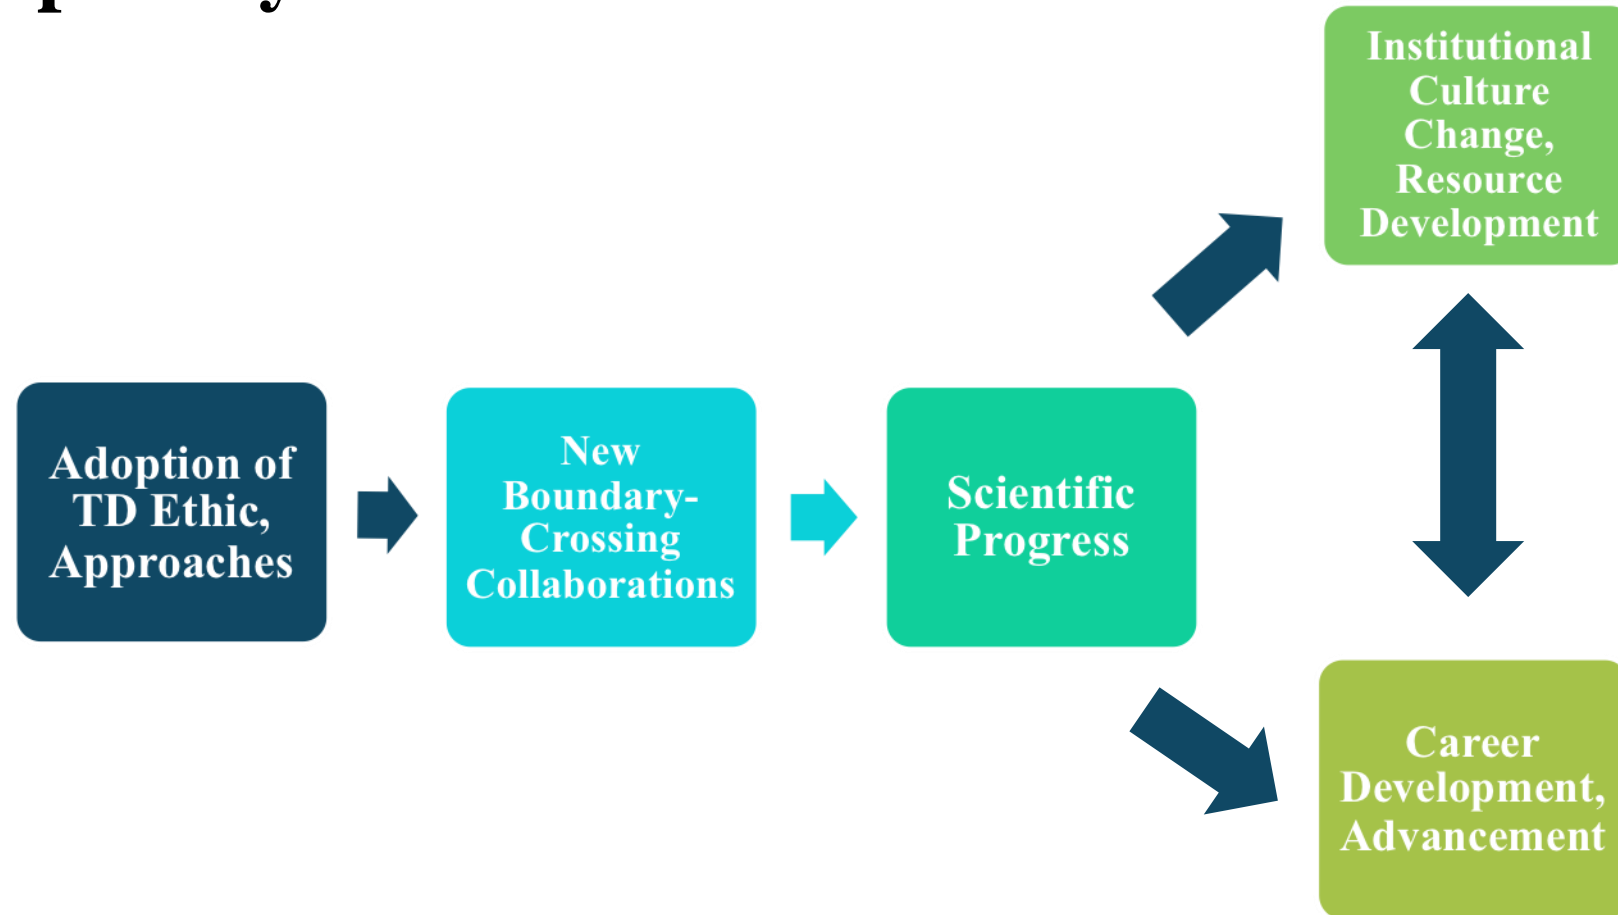

**Biochemistry**  
**Genetics**  
**Statistics**  
**Medicine**  
**Social Work**  
**Psychology**  
**Epidemiology**  
**Physical Therapy**  
**Occupational Therapy**  
**Molecular Biology**  
**Systems Science**  
**Urban Planning**

**Anthropology**  
**Economics**  
**Nutrition**  
**Sociology**  
**Metabolism**  
**Etc.**

# Challenges in Transdisciplinary Team Science

- **Conceptual and Scientific Challenges**
  - Lack of **clarity** about “what TD is” & “how you get there”
  - TD science “**stretches**” investigators’ intellectual “capacity” more than UD research
  - TD research is **more complex** than UD research
- **Different Disciplinary Cultures Among Collaborators**
  - Differences in **values, language, traditions**
  - Team members want to stay in their “**comfort zone**” (re: disciplinary culture)
- **Management Challenges**
  - TD research = **more** time, resources, planning, and management than UD research
  - **Compromise**, change in routines (e.g., data management)
  - Physical distance = communication challenges, slowed research process
- **Incentive and Recognition Systems and Academic Norms**
  - Academic incentives have **not yet “caught up”** to TD research (e.g., P&T criteria, limited funding opportunities, publishing venues)
  - Colleagues may be **unfamiliar with TD research** (e.g., IRB, grant/manuscript review)

# Impact of Participating in a Transdisciplinary Research Initiative

Vogel, A. L., Stipelman, B. A., Hall, K. L., Stokols, D., Nebeling, L., & Spruijt-Metz, D. (2014). Pioneering the transdisciplinary team science approach: Lessons learned from National Cancer Institute grantees. *The Journal of Translational Medicine and Epidemiology*, 2(2): 1027, p1-13.

# Enhancing Team Science

## Overall we found increases in:

- **Integration** (e.g., TD ethic, orientation, and approaches; decrease in specialization)
- **Collaboration** (i.e., across individuals, projects/centers, levels of analysis)
- **Productivity** – (number of publications over time)
- **Reach** - (e.g., spread across map of science, new journals and conferences)
- **Impact** (e.g., impact factor, citations)

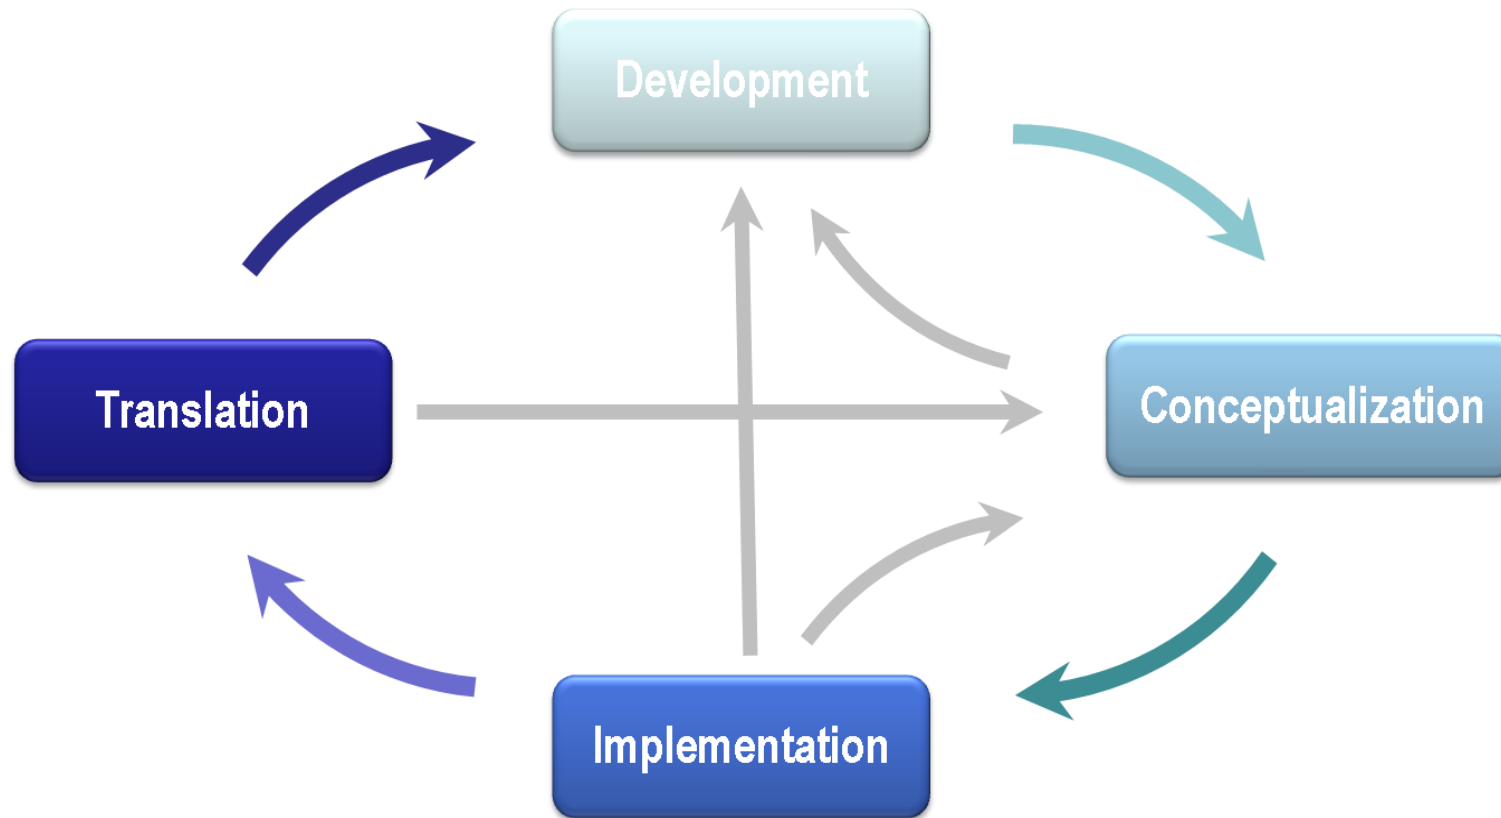

## Findings help to illustrate:

- Added value of TD research
- With structures in place to help mitigate cultural and structural barriers, we can enhance the way investigators conduct research, engage in collaboration, and advance science

## **Build on emerging evidence and lessons learned** to most effectively and efficiently advance our science

- There are conceptual models, practical strategies, and resources to help guide and support the conduct of research at the team, center, and initiative levels

# Four Phase Model of Transdisciplinary Research

Hall, KL, Vogel, AL, Stipelman, B, Stokols, D, Morgan, G, & Gehlert, S. (2012). A four-phase model of transdisciplinary research: goals, processes and strategies. *Translational Behavioral Medicine*, 2, 4, 415-430.

# Development Phase

## Goals & Key Processes

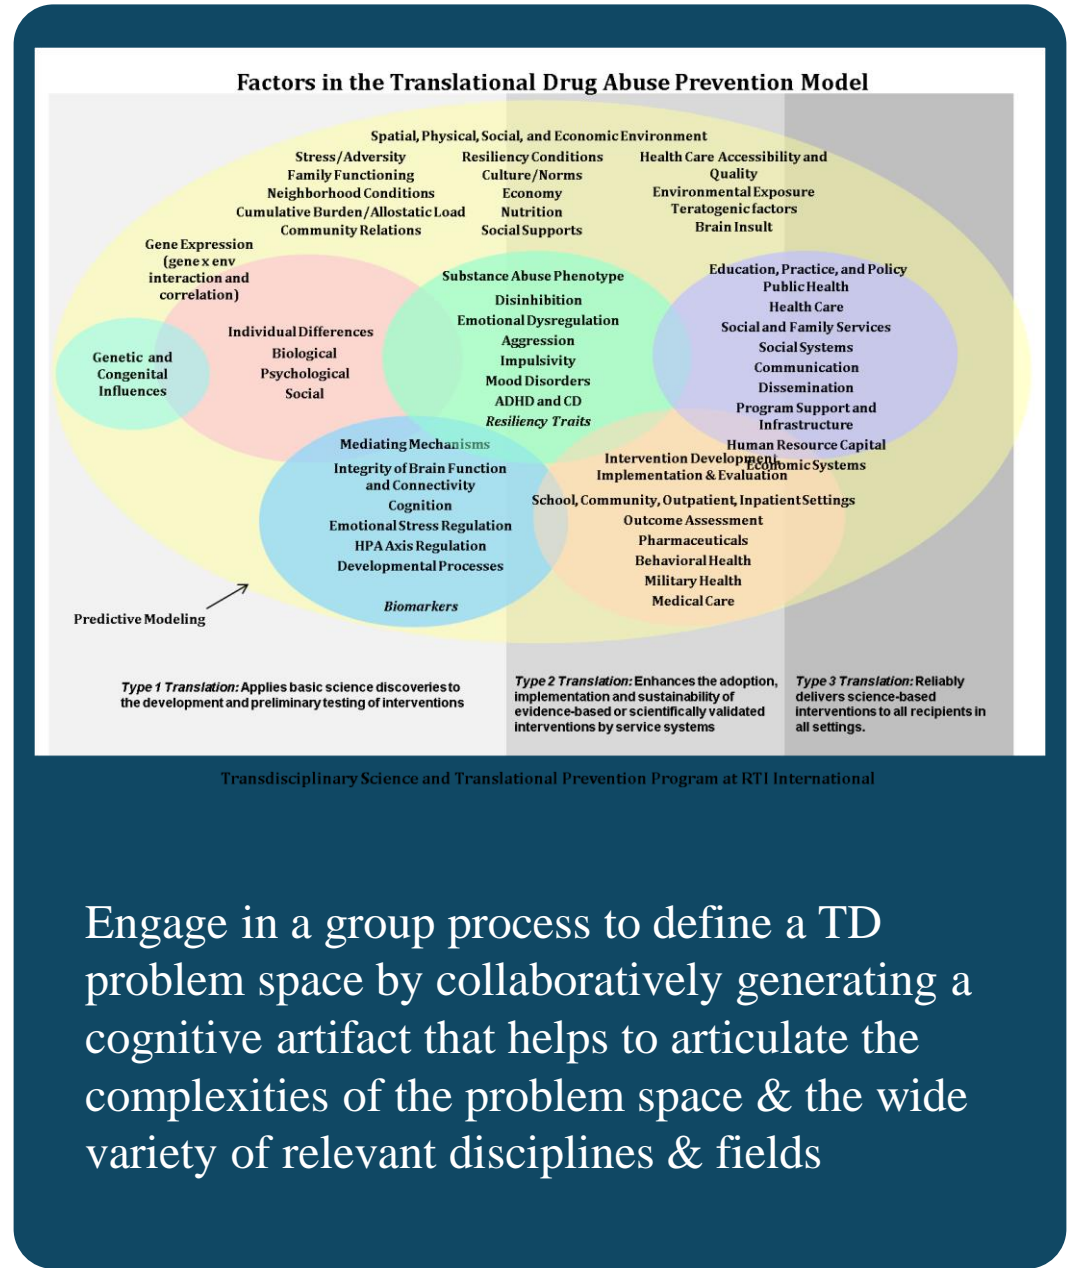

**Goal:** Define the scientific or societal **problem space** of interest, including identifying the intricacies & interconnections of concepts that fall within the problem space & establishing the boundaries of the problem space to be addressed

**Key Processes:** Encourage information sharing & integrative knowledge creation among diverse participants

- **Generate shared mission & goals**
- **Develop critical awareness**
- **Externalize group cognition**
- **Support group environment of psychological safety**

### Team Type:

- Network, working group, advisory group, emerging team

Engage in a group process to define a TD problem space by collaboratively generating a cognitive artifact that helps to articulate the complexities of the problem space & the wide variety of relevant disciplines & fields

# Conceptualization Phase

## Goals & Key Processes

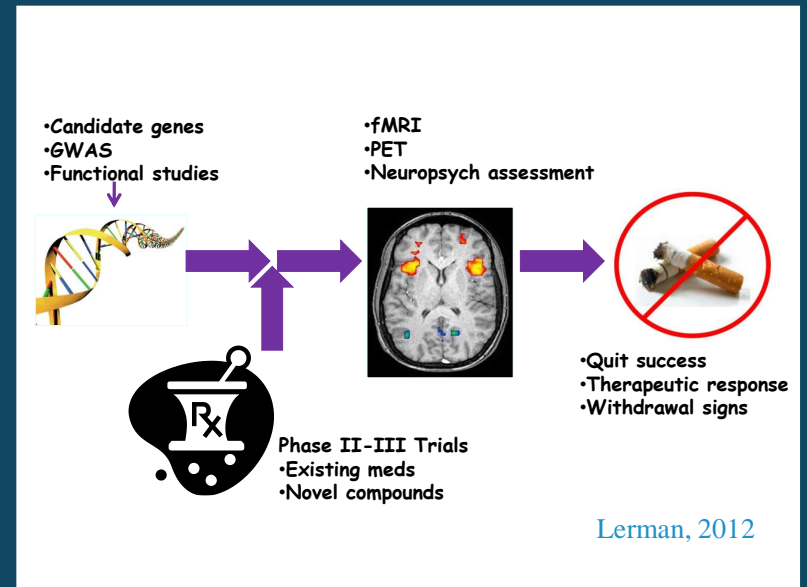

**Goal:** Develop novel research questions, hypotheses, & a conceptual framework & research design that integrate collaborators' disciplinary perspectives & knowledge domains to address the target problem in innovative ways.

**Key Processes:** Facilitate integrative knowledge creation among team members & development of a research plan

- **Create shared mental models**
- **Generate shared language**
- **Develop compilational transactive memory**
- **Develop team TD ethic**

### Team Type:

- Emerging team, evolving team

Use of seminars among collaborators to help develop compilational transactive memory, shared language, team TD ethic, & shared mental model of research collaboration.

- Encourage use of glossary
- Yellow cards

# Implementation Phase

## Goals & Key Processes

**Goal:** Launch, conduct, & refine the planned TD research

### Key Processes:

- Developing a **shared understanding** (transactive memory)
  - **who *knows* what** (compilational)
  - **who *does* what** (compositional)
  - **how things get done** (taskwork)
  - **how interactions occur** among the team (teamwork)
- **Conflict Management**
- **Team Learning** (e.g., reflection, action, feedback, discussion)

### Team Type:

Real team

## “Real” vs “Pseudo” team

Characteristics that lead to increased performance & innovation:

- **Interdependence**
- **Iterative reflection**
  - systematic consideration of team performance & participation in related adaptation to team goals & processes
- **Clear understanding of team membership**

# Translation Phase

## Goals & Key Processes

**Goal:** Apply research findings to **advance progress along the discovery–development–delivery pathway** to ultimately provide innovative solutions to real-world problems

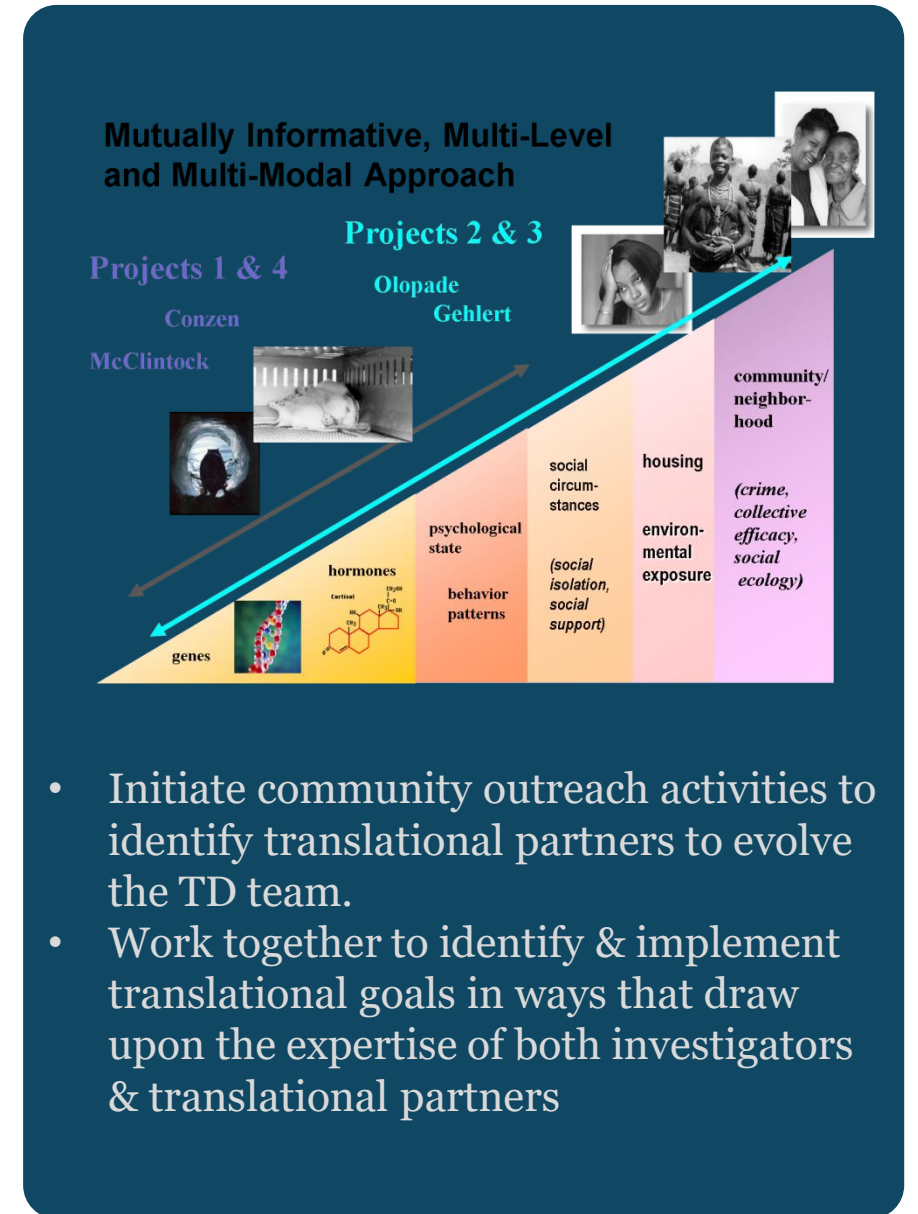

### Key Processes:

- The **evolution of the team**, as needed, to identify & pursue translational goals
- Development of **shared goals** for the translational endeavor
- Development of **shared understandings of how these goals will be pursued**

### Team Type:

Adapted team, new team

Source: Hall, KL, Vogel, AL, Stipelman, B, Stokols, D, Morgan, G, & Gehlert, S. (2012). A Four-Phase Model of Transdisciplinary Research : Goals, Processes and Strategies. *Translational Behavioral Medicine*, 2 (4).

# Practical and Strategic Considerations

1. Support the identification, adaptation, and use of **tools and resources**
2. Consider elements of a **Collaboration Plan** that your university can bolster
3. Address need for personnel (faculty/staff/students) with **team science competencies**
4. Support **Development Phase** work
5. Identify ways to support / recognize the value of **setting and maintaining strategic visions**
6. Align **Promotion and Tenure** policies with team science

# Tools For Setting Expectations, Preventing Conflict, and Planning For Success in TS

- **Investigator level:**
- **“Welcome to my Team” Letter**
  - Provides a scaffold for building deeper trust including: what you can expect of the team, what the team expects of you, and what to do if we disagree
- **Team level:**
- **Pre-collaboration Agreement (AKA Prenup for Scientists)**
  - Jointly created agreements among collaborators (formal or informal)

## **PREEMPTING DISCORD: PRENUPTIAL AGREEMENTS FOR SCIENTISTS**

**AUTHORS: HOWARD GADLIN AND KEVIN JESSAR**

### **In a nutshell:**

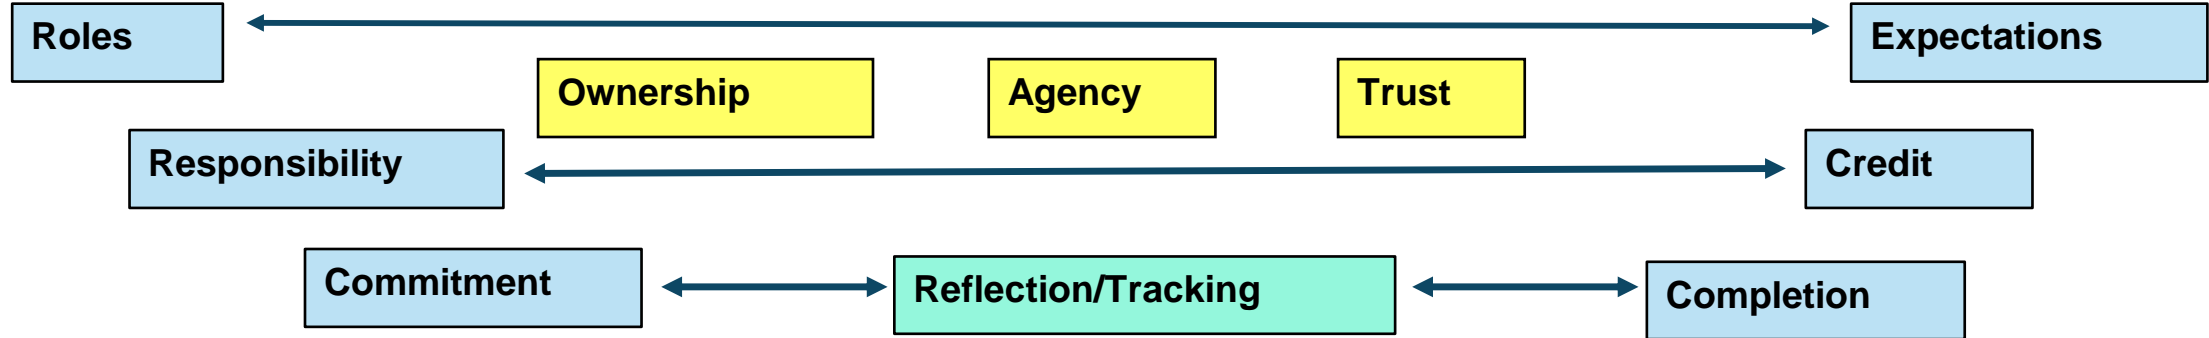

Prepared by the National Institutes of Health’s Office of the Ombudsman, this document provides a discussion guide to help potential collaborators anticipate, discuss, and resolve possible areas of disagreement common to many collaborations. Access the full resource at – [www.teamsciencetoolkit.cancer.gov/public/TSResourceTool.aspx?tid=1&rid=53](http://www.teamsciencetoolkit.cancer.gov/public/TSResourceTool.aspx?tid=1&rid=53)

### **More information:**

The document helps potential collaborators to identify and discuss their implicit or explicit

# Clarification and Commitment

## Roles and Responsibility Documentation – Living document

- Starting Roles/Responsibility
- Secondary & Emerging Roles/Responsibility
- Member Commitments
- Tracking of Responsibilities and Accomplishments.

The screenshot shows the PNAS (Proceedings of the National Academy of Sciences of the United States of America) website. The navigation bar includes 'Home', 'Articles', 'Front Matter', 'News', 'Podcasts', and 'Authors'. Below the navigation bar, there is a search bar with the text 'Keyword, Author,' and a dropdown menu for 'NEW RESEARCH IN' with 'Physical Sciences' selected and 'Social Sciences' as an option. The main article title is 'Transparency in authors' contributions and responsibilities to promote integrity in scientific publication'. The authors listed are Marcia K. McNutt, Monica Bradford, Jeffrey M. Drazen, Brooks Hanson, Bob Howard, Kathleen Hall Jamieson, Véronique Kiermer, Emilie Marcus, Barbara Kline Pope, Randy Schekman, Sowmya Swaminathan, Peter J. Stang, and Inder M. Verma. The article was published in PNAS March 13, 2018, 115 (11) 2557-2560, and published ahead of print February 27, 2018. The DOI is <https://doi.org/10.1073/pnas.1715374115>. The article was edited by Karen S. Cook, Stanford University, Stanford, CA, and approved January 18, 2018 (received for review August 30, 2017).

# Tools For Setting Expectations, Preventing Conflict, and Planning For Success in TS

- **Initiative level: Operating Manual**
  - Describe expected roles, responsibilities, procedures, etc. for investigators and staff across research centers
    - Ideal for large, complex collaborations that may include multiple institutions/centers
- **All levels: Collaboration Plan**
  - Detailed plan that describes multi level ways the group will plan for and support effective collaboration

**Transdisciplinary Research on Energetics and Cancer**

**(TREC)**

**Manual of Operations**

**Version 2.6**

Collaboration Plans: Planning for Success in Team Science			
<small>           Kara L. Moll, Ph.D., Health Scientist and Director, SOTC Team, Behavioral Research Program, National Cancer Institute, National Institutes of Health, Bethesda, MD 20892            Amanda L. Vigne, Ph.D., M.P.H., Senior Behavioral Scientist, Cancer Research Directorate/CDR, Leidos Biomedical Research, Inc., Perle's National Laboratory for Cancer Research, Frederick, MD 21702            Karla Crowther, Ph.D., Distinguished Professor of Information Science, Syracuse University School of Information Studies, Syracuse, NY 13244         </small>			
COMPONENT	CONSIDERATIONS	COMPONENT	CONSIDERATIONS
<b>1 Rationale for Team Approach &amp; Configuration</b> Identify why a team approach is necessary to meet the research objectives. Describe why the team configuration meets the proposed research objectives (e.g., how each team member brings expertise).	As the number of collaboration increases, so do the potential challenges. For transdisciplinary teams, the discipline must be "scientifically ready" for collaboration. Not all research questions are best addressed using a team approach or require a large, complex, or distributed team. Generally, a team should not include more researchers than necessary, but should include sufficient breadth to address the varied scientific expertise.	<b>6 Leadership, Management, &amp; Administration</b> Describe the leadership and management approaches that will be used to coordinate the other components of the collaboration plan, given the specific team context that has been proposed (e.g., the individual team members, team characteristics, individual institutions and organizations).	There are numerous approaches to leadership (e.g., hierarchical, heterarchical, transformational, transactional). The most successful outcomes are produced by combining various approaches as appropriate to the context. Leadership and management are key influences on the success of a scientific collaboration. More complex team science initiatives require more sophisticated leadership and management approaches.
<b>2 Collaboration Readiness</b> Provide evidence for the collaboration readiness of: (1) the individual researchers, (2) the team as a unit, and (3) the institutional and organizational settings involved. A given project may not have high levels of collaboration readiness in all of these areas. A plan may highlight strengths and describe strategies to compensate for any weaknesses.	Individual characteristics may increase success (e.g., interdisciplinary team formation, preparation for complexity and breadth of collaboration). Team history of collaboration, especially teams with some former collaborators and some new members, may increase success. Institutional policies, procedures, resources, infrastructure may influence success (e.g., personnel and career policies, research development efforts, training for team science).	<b>7 Conflict Prevention &amp; Management</b> Describe strategies and systems for preventing and managing conflicts (e.g., processes for resolving and escalating disagreements, preventing or managing negative forms of conflict, encouraging dialogue and facilitating productive forms of conflict, and resolving conflict). Many sources of team conflict can be anticipated, and strategies should be developed to avoid them.	Disruptive and disruptive diversity both may lead to conflict, but the specific cause of conflict, and the ways to which conflict play out, will vary with the specific combination of types of diversity on the team. Leadership and management are key influences on the success of a scientific collaboration. More complex team science initiatives require more sophisticated leadership and management approaches.
<b>3 Technological Readiness</b> Document the availability and planned use of technological resources, including: Data sharing and collaborative data analysis (e.g., sharing agreements, common data analysis and management software, interoperability (e.g., open and nonproprietary), security, and audit. Coordination (e.g., coordinating work flow or project management).	IT includes 2 components: (1) technology must be available; (2) members must be willing to use the technology; and (3) members must have the skills to use them. Institutions may include responsibility and transparency of system access; collaboration; decreasing concerns whose systems processes will be used.	<b>8 Training</b> Describe a training plan for team members of the start of the collaboration and throughout the training relevant to team processes, leadership, management, communication, coordination. For interdisciplinary (ID) teams, this plan should include cross-training in relevant scientific areas, and training in ID science competencies (e.g., cultural awareness of the strengths and weaknesses of all disciplines, strategies for combining approaches from multiple disciplines).	Training that is designed to meet a wide variety of needs, by content, timing, format, intensity, and practical concerns (e.g., web-based training for distributed teams). Evidence based training approaches exist for both individual and team (e.g., team coordination training, team reflexivity training, cross-training).
<b>4 Team Functioning</b> Describe strategies that will be used to address key team processes that are essential to effective team functioning. Examples of strategies include: development of cooperative protocols and operating manuals; participation in the TREC Project Individual Workshops (http://www.cit.nih.gov/individual); and implementation of team diagnostic surveys for quality improvement.	Strategies should take into account the unique characteristics of the team and the scientific work such as collaboration history, complexity of the work (e.g., size, clarity, dispersion, task interdependencies), phase of the research process. Strategies should be clearly defined by team processes (e.g., generating a shared vision and goals, establishing group routines, creating shared mental models, promoting trust/psychology).	<b>9 Quality Improvement Activities</b> Describe what processes will be put in place to ensure continuous quality improvement specific to team functioning (e.g., to: address challenges as they emerge; and maintain and enhance the quality of the ongoing collaboration.	Teams that engage in systematic and reflective reflection about team performance and subsequently adjust their team objectives and processes show better performance, including higher levels of innovation. For large or complex teams, it may be helpful to include suitable reports to design and implement quality improvement activities. Quality improvement may be frequent, but opportunities for reflection about team performance (e.g., pre-meeting and debriefing) may be more in depth activities (e.g., surveys, facilitated discussions/workshops).
<b>5 Communication &amp; Coordination</b> Describe key communication will occur (e.g., meeting frequency and modality). Describe strategies to coordinate day-to-day operations and the achievement of scholarly objectives (e.g., work flow, coordination of time).	Plans should be specific to your team. For example, distance collaborations increase potential communication and coordination challenges. Communication and coordination plans may vary among collaborations who vary in size, geographic and cultural, and for collaborators from different disciplines. Greater use of coordination mechanisms leads to more successful outcomes. Direct cooperation and face-to-face interactions have demonstrated effectiveness. An hour of complexity of time increases as does the need for more coordination.	<b>10 Budget &amp; Resource Allocation</b> Allocate funds to the budget for activities that facilitate the success of the team, as identified in components 1-8.	The year 3 components of regular treatments of resources that require financial support. It is necessary to allocate funds to these activities to ensure their successful implementation. Clear but flexible plans for funds may produce optimal results. This can be particularly important in large and more complex situations, when there is a greater likelihood for changes to the collaboration over the course of the initiative.

# Collaboration Plans: Planning for Success in Team Science

Kara L. Hall, Ph.D., Health Scientist and Director, ScITS Team, Behavioral Research Program, National Cancer Institute, National Institutes of Health, Bethesda, MD 20892

Amanda L. Vogel, Ph.D., M.P.H., Senior Behavioral Scientist, Clinical Research Directorate/CMRP, Leidos Biomedical Research Inc., Frederick National Laboratory for Cancer Research, Frederick, MD 21702

Kevin Crowston, Ph.D., Distinguished Professor of Information Science, Syracuse University School of Information Studies, Syracuse, NY 13244

<b>5 Communication &amp; Coordination</b>  <ul style="list-style-type: none"> <li>Describe <b>ways communication will occur</b> (e.g., meeting frequency and modality).</li> <li>Describe <b>strategies to coordinate day-to-day operations</b> and the achievement of scholarly benchmarks (e.g., work flow, coordination of data).</li> </ul>	<ul style="list-style-type: none"> <li><b>Plans should be specific to your team</b>. For example, <b>distance collaborations</b> increase potential communication and coordination challenges. Communication and coordination styles may vary among collaborators who vary in age, gender, and culture, and for collaborators from different disciplines.</li> <li><b>Greater use of coordination mechanisms</b> leads to more successful outcomes. Direct supervision and face-to-face mechanisms have demonstrated effectiveness. <b>As team complexity and size increase, so does the need for more coordination.</b></li> </ul>	<b>10 Budget &amp; Resource Allocation</b>  <ul style="list-style-type: none"> <li>Allocate <b>funds</b> in the budget for activities that <b>facilitate the success</b> of the team, as identified in components 1–8.</li> </ul>	<ul style="list-style-type: none"> <li>The prior 9 components all require investments of resources that require financial support. It is necessary to <b>allocate funds</b> to these activities to <b>ensure their successful implementation</b>.</li> <li><b>Clear but flexible plans for funds may produce optimal results</b>. This can be particularly important in larger and more complex initiatives, where there is a greater likelihood for changes to the collaboration over the course of the initiative.</li> </ul>

## Structure/Process for Scientific Content

Map charge/  
problem space

Deconstruct work/  
problem space

Configure  
People/Process

Create micro  
products

Validate/  
Integrate

Iterate content/  
process

### Division of responsibility to avoid diffusion of responsibility

Collaborators are involved in endless projects and committees... this results in challenges of imbalance of work or lost opportunities

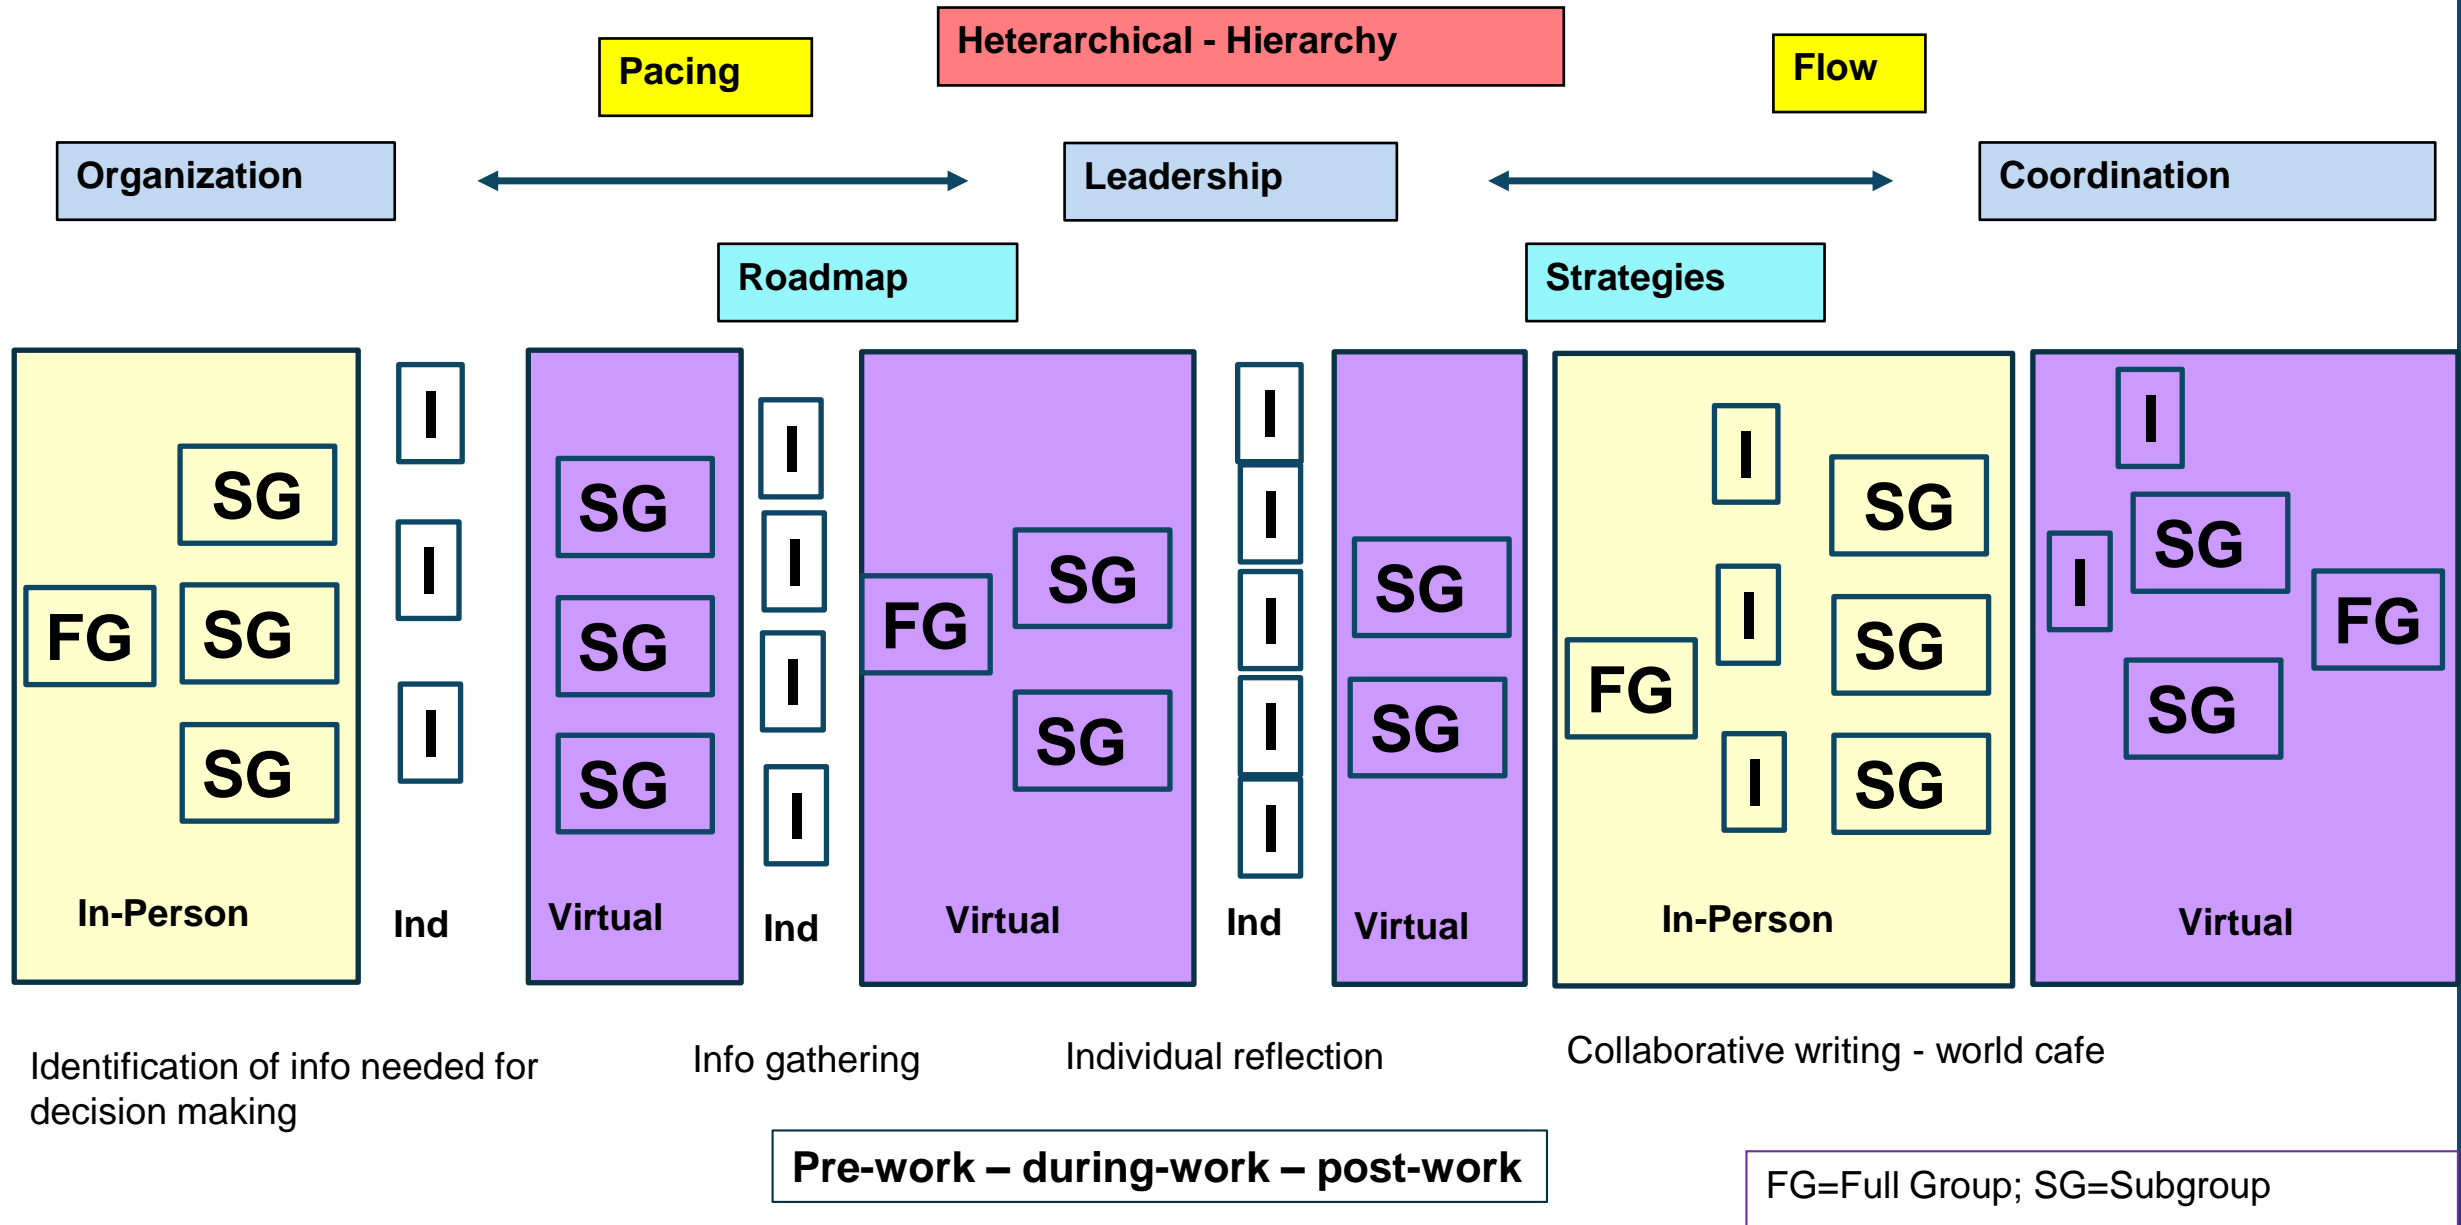

- Breakdown the objectives/projects into series of tasks
- Explication of the multiplicity of roles
- Divide into subgroups to complete tasks
- Provide explicit templates, structure
- Process for moving between full group, subgroup and independently

**Kindergarten Model**

# Structure/Process for Organization and Production in Scientific Groups

# Support for Coordination and Management

## What are the challenges?

- Inadequate appreciation of how poor coordination mechanisms influences scientific outcome, Yet **when project budgets are cut 20-30% the first items eliminated** were (Cummings & Keisler, 2005):
  - support for coordination and knowledge transfer activities – e.g., support of postdoctoral fellows, project managers, seminars, and workshops.
- Inadequate coordination, administration, management infrastructure within institutions/projects

## What is needed?

- Competencies need to be covered – solutions depend on size and complexity of teams
- Approaches to maintain support/coordination of highly skilled coordination/management staff
- Shared/pooled strategies (Cross project, department, institution) for leveraging specialized resources and skills (& consideration of new roles) (e.g., Broad Institute)
- Safety nets / Special projects to maintain and leverage skilled staff

# Support for Development Phase

## What are the challenges?

- Adequate support to break down barriers across disciplines
- Need to rapidly develop complex projects, new teams

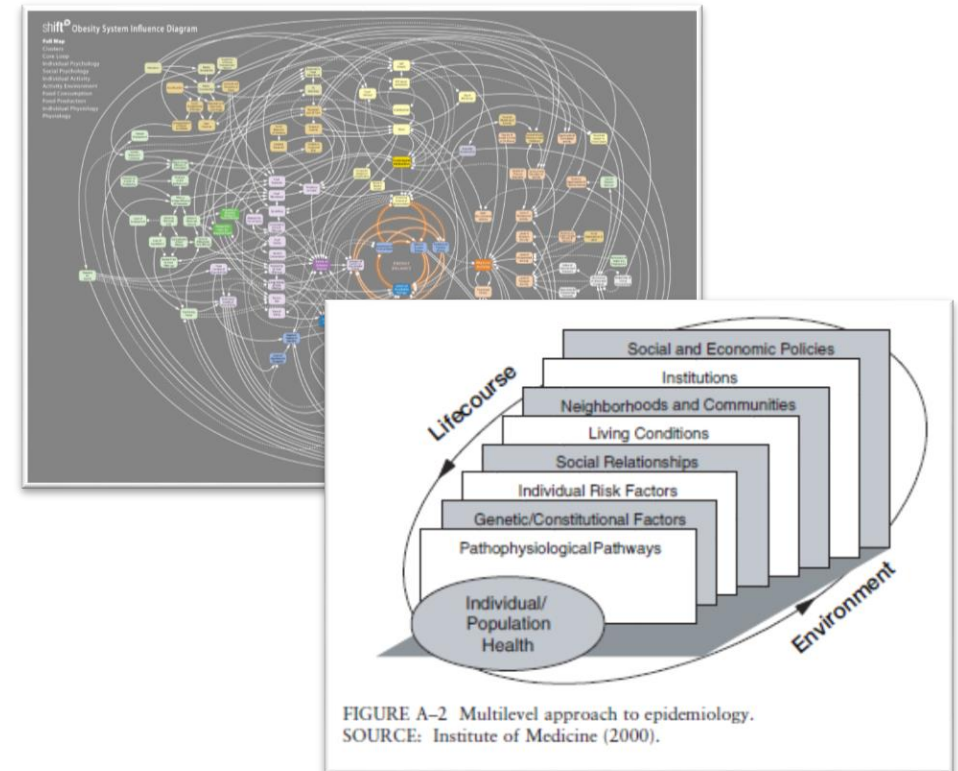

## What can be done?

- Enhance readiness of teams
  - Team formation, idea generation
- Forecast scientific areas of need/interest aligned with strategic capabilities
  - Discussions, roundtables, workshops, meetings, special issues, commentaries, blogs

## What are some strategies?

- Research networking tools
- Use of seed funds (structured processes, strategic priorities)

The societal & scientific problems are complex –

Multi-level, multi-factorial,  
interacting influences

# Strategies for Stimulating New Collaborations and Innovative Ideas

## New Collaborations

- The provision of resources such as **seed funding for pilot projects, or retreats**, have been linked to increases in new collaborations

## New Grant Funding

- Medical University of South Carolina's CTSA - South Carolina Clinical & Translational Research (SCTR) Institute - has initiated biannual scientific retreats often with **speed dating style networking sessions**.
  - The average cost per retreat ~\$5,000
  - Estimate of extramural grant funding stemming from the five retreats was \$20,228,047
  - ROI = **\$809 for each dollar spent on the retreats**.

## New Ideas – strategic visions, programs of research

- NCI, NSF, DOD, NAS supporting Ideas labs

# Facilitating Novel Projects and Teams – Process Matters

## Setting the Stage

*Picasso in a Bag*

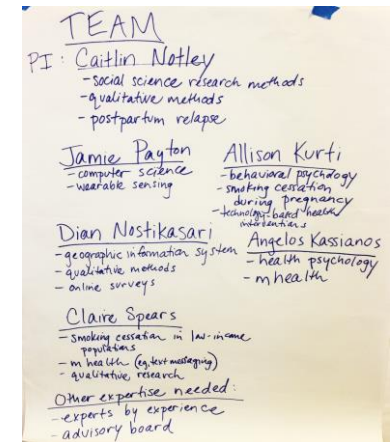

## Idea Generation

Questions, Clustering, Teaming

## Project Development

*Team Formation*

*Pair Introductions*

*Mental Models*

*Project Pitches*

*Speakers - Speed dating*

*Feedback – Soap boxes*

*Expert Review - Funding*

# Creating and Maintaining a Vision

## Use of Advisory Boards (Internal & External)

- Feedback within and across projects
- Counterbalance regression toward the mean of UD functioning by forcing the bigger picture of an initiative
- Facilitate communication & collaboration among projects
- Instrumental in nudging change regarding university structures, operations, and policies to foster transdisciplinary team science

**Critical Nature of Setting Visions:** University, Schools, Departments, Institutes, Centers, Projects

- Who does it?
- How are they trained?
- Are they recognized/rewarded?
- What are the implications?

## Examples of Recommendations

Topic	Actions
Resource utilization	Use of female pups from one study and expand vs sacrifice
Translation	Shift of timing of pilot funds to encourage earlier results
Integration of projects/cores	Projects sharing data elements and measures
Change in university culture for TS	Discussions resulting in P&T policies

Adapted from Gehlert et al. in press

## “Real” vs “Pseudo” team

Characteristics that lead to increased performance & innovation:

- **Interdependence**  
Pooled, sequential, reciprocal
- **Iterative reflection**  
Systematic consideration of team performance & participation in related adaptation to team goals & processes
- **Clear understanding of team membership**

## **Promotion and Tenure Criteria for Evaluation of TS and/or ID Research Contributions**

1. **Independence** within or regardless of involvement in a team
2. **Reputation** for being a team researcher or in spite of involvement of team
3. **Leadership** in or leadership of a collaboration
4. **Demonstrating TS & ID skills and competencies**

# Promotion and Tenure

Disciplinary-oriented Independent Scientist	Transdisciplinary Team Scientist
Independence	Interdependent

## Independence within/regardless of team involvement

- Provided a *definition of independence* in the context of collaborative work (e.g., *as primary decision maker for his or her portion of a program of research* (Indiana U MS 2016)).
- Suggested faculty to *seek ways to establish independence* particularly when collaborative with senior colleagues (U Illinois Chicago CA 2016).
- Stated dossier must include evidence or *document contributions to collaborative research that indicated a faculty members independence* (U of Michigan CA, 2016; U of Minnesota MS, 2016).
- Included language that was *contradictory* in nature by stating “ it is vital to establish the *autonomous role played* by the candidate *in collaborative* publications and grant proposals.” (Indiana U CA 2016)

# Aligning Our Context

Our scientific enterprise is largely misaligned with the critical need we for working in diverse teams in order to solve our scientific and societal challenges.

- Education
- Training
- Rewards & Recognition
- Academic structures
- Publication venues
- Team Functioning
- Strategic Planning
- Funding
- Grant Review

There are boundless opportunities from where each of us sit to influence our culture

# Closing: Opportunities

1. Support the identification, adaptation, and use of **tools and resources**
  - e.g., Collaboration Plans, on-boarding letters, conflict prevention strategies
2. Consider elements of **Collaboration Plan** that your university can bolster
  - e.g., policies that support team science, collaborative technologies
3. Address need for personnel (faculty/staff/students) with **team science competencies**
  - e.g., more stable support for advanced project management staff, faculty training
4. Support **Development Phase** work
  - e.g., ideas labs, strategic use of pilot funds
5. Identify ways to support/recognize the value of **setting and maintaining strategic visions**
  - e.g., at all levels, external/internal advisory boards, incentives at the department level
6. Align **Promotion and Tenure** policies with team science
  - e.g., addressing incremental steps, considerations of paradigm shifts

# Team Science Resources

## Team Science Toolkit

[www.teamsciencetoolkit.cancer.gov](http://www.teamsciencetoolkit.cancer.gov)

## Annual SciTS Conference

<http://www.scienceofteamscience.org/>

## SciTSlist listserv hosted by NCI

[www.teamsciencetoolkit.cancer.gov/Public/RegisterListserv.aspx](http://www.teamsciencetoolkit.cancer.gov/Public/RegisterListserv.aspx)

The screenshot shows the National Cancer Institute Team Science Toolkit website. The header includes the NCI logo and the text "National Cancer Institute at the National Institutes of Health | www.cancer.gov". The main title is "Team Science Toolkit" with a subtitle "An interactive website to help you support, conduct and study team-based research." Below the title is a navigation menu with links: Home, About Team Science, About the Toolkit, Discover, Contribute, Connect, News & Events, and About Us. The "Discover" link is highlighted. The main content area features a featured article titled "Interdisciplinary Research and Team Science" with a brief description and a "Learn More" link. To the right of the article is a word cloud with "INTERDISCIPLINARY" as the largest word. Below the article are three sections: "Discover what resources are available." with a search bar and "Browse" button; "Contribute new resources to the Toolkit." with a description; and "Connect to colleagues across disciplines." with a description. On the right side, there are links for "Login | Register", "What Users Are Saying >", "Recently Added Resources" with a list of items, and a "Resources" sidebar with links for Tools, Measures, Bibliography, Editors' Picks, and Connections. At the bottom right, there is a banner for the "SciTS 2019 Conference" held from May 20-23, 2019, in Lansing, Michigan, featuring the SciTS logo and a background image of a building and trees.
